We are deeply indebted to the many funding agencies and organizations that have supported SBML over the years.

Since 2003, primary support for the continued development of SBML, as well as supporting software and activities, has come from the **National Institute of General Medical Sciences (NIH/NIGMS)** under grants R01 GM070923 and R01 GM077671. Additional support is provided by the **California Institute of Technology** (USA) and **Keio University** (Japan).

The development of SBML from its inception through 2003 was principally funded by the **Japan Science and Technology Agency** under the **ERATO Kitano Symbiotic Systems Project**.

Additional support has in the past been provided by the following organizations and agencies: the **Systems Biology Institute** (Japan), the **University of Hertfordshire** (UK), the **Molecular Sciences Institute** (USA), the **National Human Genome Research Institute** (USA), the **International Joint Research Program of NEDO** (Japan), the **ERATO-SORST** Program of the Japan Science and Technology Agency (Japan), the **Ministry of Agriculture** (Japan), the **Ministry of Education, Culture, Sports, Science and Technology** (Japan), the **BBSRC e-Science Initiative** (UK), the **DARPA IPTO Bio-Computation Program** (USA), the Army Research Office's **Institute for Collaborative Biotechnologies** (USA), and the **Air Force Office of Scientific Research** (USA).

SBML Model Report

Model name: "EnzymaticReaction"

SBML2LaTeX

June 30, 2009

1 General Overview

This is a document in SBML Level 2 Version 3 format. Table 1 gives an overview of the quantities of all components of this model.

Table 1: The SBML components in this model.
All components are described in more detail in the following sections.

Element	Quantity	Element	Quantity
compartment types	0	compartments	1
species types	0	species	4
events	0	constraints	0
reactions	2	function definitions	0
global parameters	0	unit definitions	2
rules	0	initial assignments	0

2 Unit Definitions

This is an overview of seven unit definitions. The units `substance`, `volume`, `area`, `length`, and `time` are predefined by SBML and not mentioned in the model.

2.1 Unit `per_second`

Definition s^{-1}

2.2 Unit `litre_per_mole_per_second`

Definition $mol^{-1} \cdot l \cdot s^{-1}$

2.3 Unit `substance`

Notes Mole is the predefined SBML unit for `substance`.

Definition mol

2.4 Unit `volume`

Notes Litre is the predefined SBML unit for `volume`.

Definition l

2.5 Unit `area`

Notes Square metre is the predefined SBML unit for `area` since SBML Level 2 Version 1.

Definition m^2

2.6 Unit `length`

Notes Metre is the predefined SBML unit for `length` since SBML Level 2 Version 1.

Definition m

2.7 Unit `time`

Notes Second is the predefined SBML unit for `time`.

Definition s

3 Compartment

This model contains one compartment.

Table 2: Properties of all compartments.

Id	Name	SBO	Spatial Dimensions	Size	Unit	Constant	Outside
cytosol			3	10^{-14}	l	☑	

3.1 Compartment cytosol

This is a three-dimensional compartment with a constant size of 10^{-14} litre.

4 Species

This model contains four species. Section 6 provides further details and the derived rates of change of each species.

Table 3: Properties of each species.

Id	Name	Compartment	Derived Unit	Constant	Boundary Condition
ES	ES	cytosol	$mol \cdot l^{-1}$	☐	☐
P	P	cytosol	$mol \cdot l^{-1}$	☐	☐
S	S	cytosol	$mol \cdot l^{-1}$	☐	☐
E	E	cytosol	$mol \cdot l^{-1}$	☐	☐

5 Reactions

This model contains two reactions. All reactions are listed in the following table and are subsequently described in detail. If a reaction is affected by one or more modifiers, the identifiers of the modifier species are written above the reaction arrow.

Table 4: Overview of all reactions

№	Id	Name	Reaction Equation	SBO
1	veq		$E + S \rightleftarrows ES$	
2	vcat		$ES \longrightarrow E + P$	

5.1 Reaction veq

This is a reversible reaction of two reactants forming one product.

Reaction equation

$$E + S \longrightarrow ES \tag{1}$$

Reactants

Table 5: Properties of each reactant.

Id	Name	SBO
E	E	
S	S	

Product

Table 6: Properties of each product.

Id	Name	SBO
ES	ES	

Kinetic Law

Derived unit $s^{-1} \cdot mol$

$$v_1 = \mathrm{vol}(\mathtt{cytosol}) \cdot (\mathtt{kon} \cdot [E] \cdot [S] - \mathtt{koff} \cdot [ES]) \tag{2}$$

Table 7: Properties of each parameter.

Id	Name	SBO	Value	Unit	Constant
kon			1000000.0	$mol^{-1} \cdot l \cdot s^{-1}$	☑
koff			0.2	s^{-1}	☑

6 Derived Rate Equations

When interpreted as an ordinary differential equation framework, this model implies the following set of equations for the rates of change of each species.

6.1 Species ES

Name ES

Initial amount 0 mol

This species takes part in two reactions (as a reactant in vcat and as a product in veq).

$$\frac{d}{dt}ES = v_1 - v_2 \tag{5}$$

6.2 Species P

Name P

Initial amount 0 mol

This species takes part in one reaction (as a product in vcat).

$$\frac{d}{dt}P = v_2 \tag{6}$$

6.3 Species S

Name S

Initial amount 10^{-20} mol

This species takes part in one reaction (as a reactant in veq).

$$\frac{d}{dt}S = -v_1 \tag{7}$$

6.4 Species E

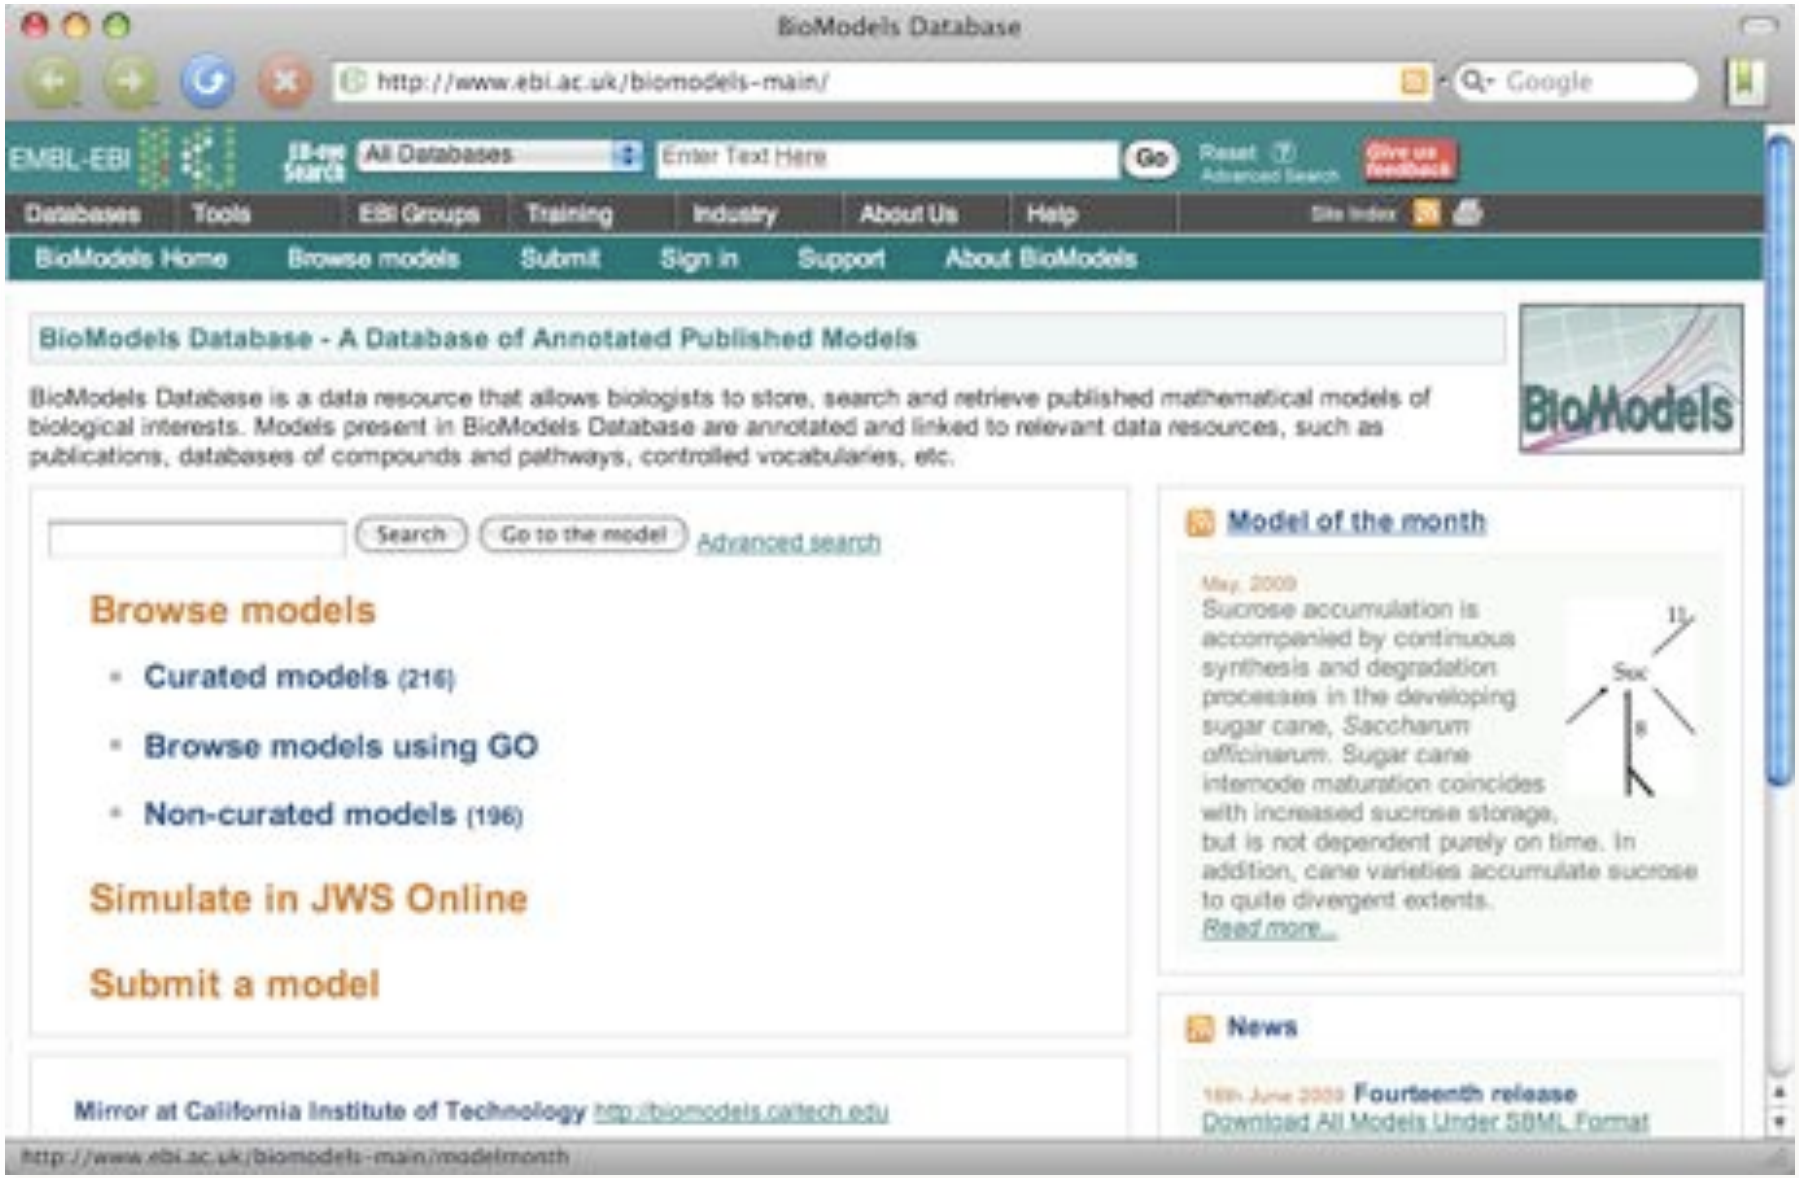
Name E

Initial amount $5 \cdot 10^{-21}$ mol

This species takes part in two reactions (as a reactant in veq and as a product in vcat).

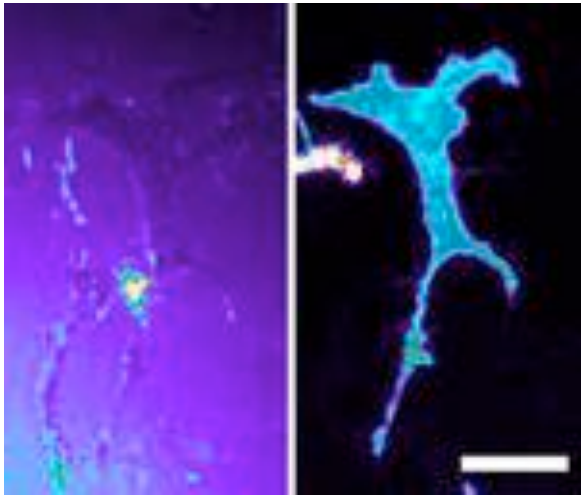
$$\frac{d}{dt}E = v_2 - v_1 \tag{8}$$

es gibt bereits sehr viele Modelle



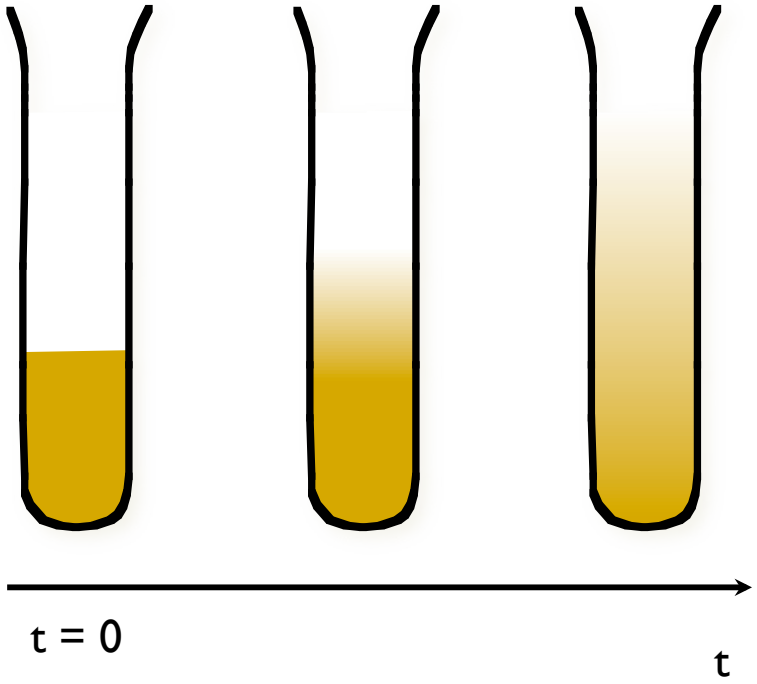
Prozesse in einer Zelle

Schneider und Haugh "Quantitative elucidation of a distinct spatial gradient-sensing mechanism in fibroblasts", *JCB* **171** (2005) 883



PI 3-kinase signaling in response to a transient PDGF gradient. The video depicts the experiment presented in Fig. 5 A of the paper, with TIRF time courses of the extracellular OG 514-dextran gradient (left) and intracellular CFP-AktPH translocation response (right). A CFP-AktPH-transfected fibroblast was stimulated with a moving PDGF gradient for 21 min, after which a uniform bolus of 10 nM PDGF and subsequently wortmannin were added (additions indicated by the flashing screen). The video plays at 7.5 frames/s (150x speed up). Bar, 30 µm.

Diffusion



Diffusion
=> verschmiert Unterschiede

Entwicklung der ortsabh. Dichte
<=> Diffusionsgleichung

$$\rho(\vec{r},t) = \frac{\Delta N(\vec{r},t)}{\Delta V}$$

+ ortsabhängige Quellen und Senken

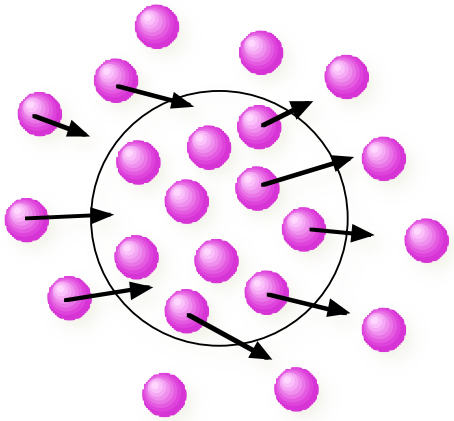
Kontinuitätsgleichung

Zwei Beiträge zur Diffusionsgleichung:

1) Kontinuitätsgleichung: wo bleibt das Material?

$$\frac{\partial \rho(\vec{r},t)}{\partial t} = -\nabla \vec{j}(\vec{r},t) = -\mathrm{div}\ \vec{j}(\vec{r},t)$$

Änderung der Dichte ρ bei (r, t) — Divergenz des Stromes = Quellen und Senken für Teilchen



partielle Ableitung:
=> betrachte nur Änderungen von ρ in der Zeit an einem festgehaltenen Ort r (nicht: Ortsverschiebungen r = r(t))

$$\Delta N = N_{in} - N_{out} = 3 - 5 = -2$$

Diffusionsstrom

2) Diffusionsstrom durch Dichteunterschiede (Gradienten) – Fick'sches Gesetz:

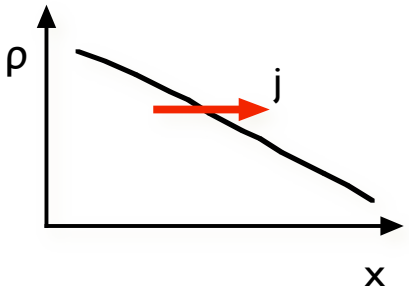
$$\vec{j}(\vec{r},t) = -D\ \nabla\rho(\vec{r},t) = -D\ \text{grad}\ \rho(\vec{r},t)$$

Diffusionstrom bei (r, t)

Strom fließt weg von hohen Dichten

Diffusions–koeffizient

Dichte-fluktuationen (=Gradienten)

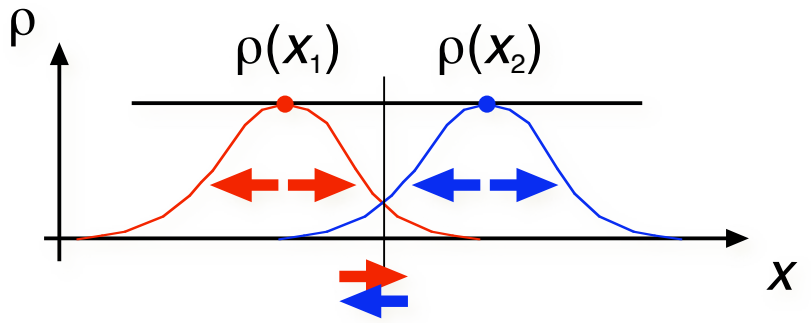


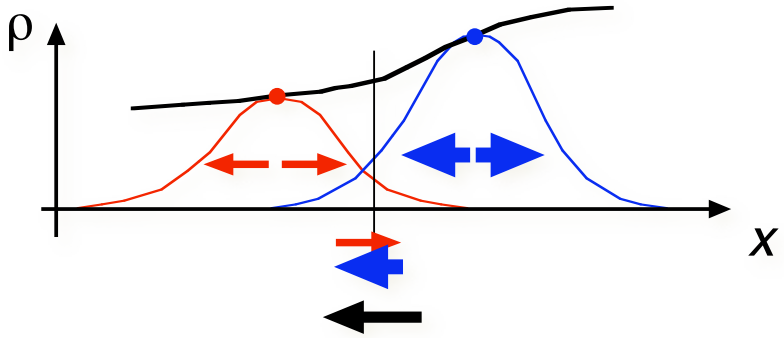
hier: phänomenologischer Umrechnungsfaktor von Dichteunterschieden in Teilchenströme

Diffusion mikroskopisch

Ohne externe Kräfte

=> Teilchen bewegen sich in alle Richtungen gleich wahrscheinlich
(Gauss'sche Wahrscheinlichkeit)





$\rho(x_1) = \rho(x_2) \Rightarrow j_{diff} = 0$

$\rho(x_1) < \rho(x_2) \Rightarrow j_{diff} < 0$

$$j_{diff} \propto -\frac{\rho(x_2) - \rho(x_1)}{x_2 - x_1} \Rightarrow \frac{d\rho}{dx}$$

Gleiche Dichten an x_1 und x_2:
=> gleiche Anzahl Teilchen springt
von x_1 => x_2 wie von x_2 => x_1

Unterschiedliche Dichten:
=> mehr Teilchen springen
von x_2 => x_1 als von x_1 => x_2

Diffusionsgleichung: partielle DGL

Diffusionsstrom

$$\vec{j}(\vec{r},t) = -D\ \nabla\rho(\vec{r},t) = -D\ \text{grad}\ \rho(\vec{r},t)$$

in Kontinuitätsgleichung einsetzen

$$\frac{\partial\rho(\vec{r},t)}{\partial t} = -\nabla\vec{j}(\vec{r},t) = -\text{div}\ \vec{j}(\vec{r},t)$$

=> Diffusionsgleichung:

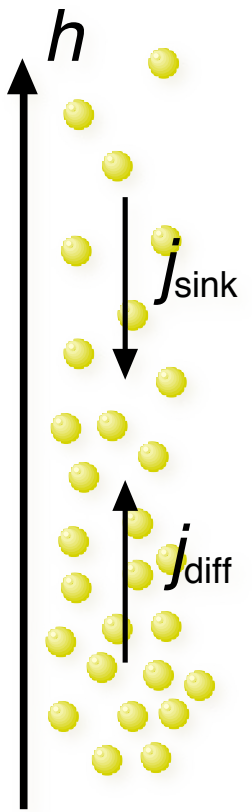
$D(\vec{r},t) = \text{const}$

$$\frac{\partial\rho(\vec{r},t)}{\partial t} = -\nabla(-D\,\nabla\rho(\vec{r},t)) = D\,\Delta\rho(\vec{r},t)$$

=> Vollständige Beschreibung der zeitabhängigen Dichteverteilung
(ohne externe Kräfte)

Zur Boltzmann-Verteilung

Diffusion unter dem Einfluß einer externen Kraft (z.B. Schwerkraft)
=> stationäre Lösung der Diffusionsgleichung



zwei Beiträge

Gravitation
=> Moleküle sinken

$$j_{sink}(h) = v\rho(h) = -\frac{mg}{\gamma}\rho(h)$$

Dichteunterschied
=> Diffusionsstrom

$$j_{diff}(h) = -D\frac{d\rho(h)}{dh}$$

stationärer Zustand: $j_{sink}(h) + j_{diff}(h) = 0$

Mit $D = \frac{k_B T}{\gamma}$ => $\frac{d\rho(h)}{dh} = -\frac{mg}{k_B T}\rho(h)$

$$\rho(h) = \rho_0 \exp\left[-\frac{mgh}{k_B T}\right]$$

stationärer Zustand ist unabhängig von D (aber: Relaxationszeit)

Integration

Bisher: (System von) ODEs

$$\frac{d}{dt}X_i = f_i(X_1, X_2, \ldots)$$

- Zeitentwicklung abhängig von den **lokalen** Werten der Systemparameter
- alle Ableitungen nach der Zeit

Jetzt: Diffusionsgl. mit konstantem D:

$$\frac{\partial \rho(\vec{r},t)}{\partial t} = D\,\Delta\rho(\vec{r},t)$$

- Zeitentwicklung bestimmt durch **globale** Werte (Verteilungen) der Variablen (gesamte Dichte ρ(r) nötig für Gradient)
- Ableitungen nach **Zeit und Ort**

FTCS–Integrator

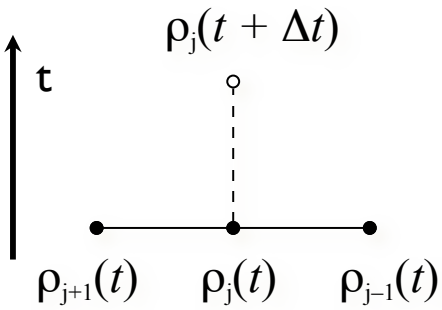
Diffusionsgleichung mit konstantem D in 1D:

$$\frac{\partial \rho(\vec{x},t)}{\partial t} = D \frac{\partial^2 \rho(\vec{x},t)}{\partial x^2}$$

Direkte Implementierung auf einem Gitter $\{\rho(x_i)\}$ mit Abstand Δx:

$$\frac{\rho_j(t+\Delta t)-\rho_j(t)}{\Delta t} = D \frac{\rho_{j+1}(t)-2\rho_j(t)+\rho_{j-1}(t)}{\Delta x^2}$$

Forward in **T**ime **C**entered in **S**pace



Propagationsschritt:

$$\rho_j(t+\Delta t) = \rho_j(t) + \Delta t\, D \frac{\rho_{j+1}(t)-2\rho_j(t)+\rho_{j-1}(t)}{\Delta x^2}$$

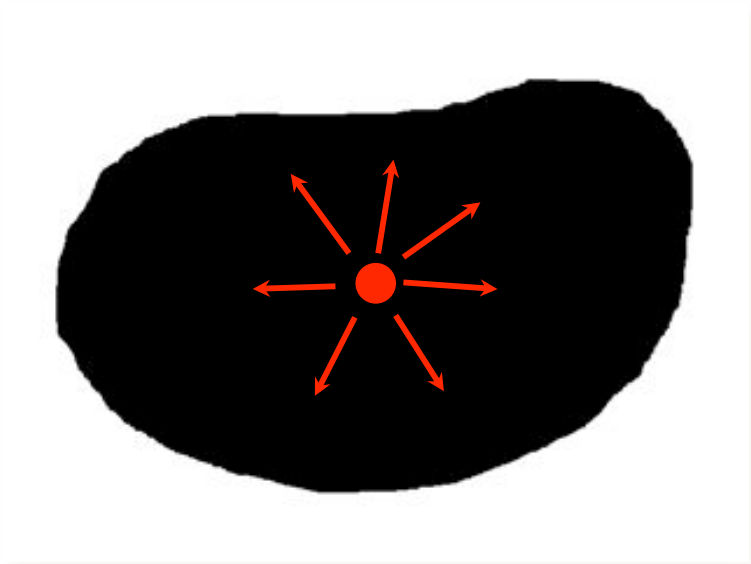
Stabil für: $\Delta t \leq \frac{\Delta x^2}{2D}$ (Δt < DIffusionszeit über Abstand Δx)

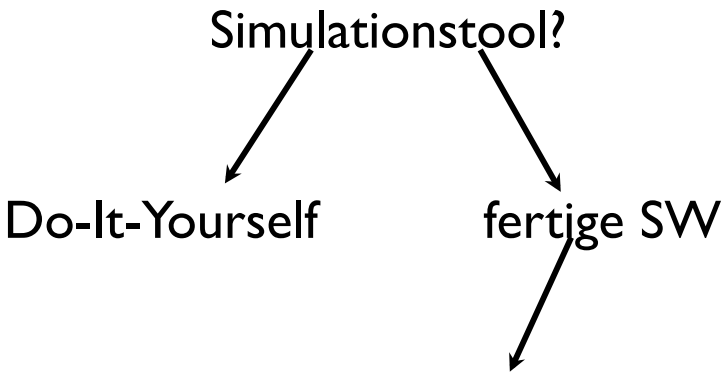
Beispiel: Diffusion

Moleküle werden bei x_s produziert und in der ganzen Zelle abgebaut

Diffusion in beliebiger Geometrie:

=> Einfluß der Wände?





- Reaktions-Diffusions-Systeme
- kontinuierliche und stochastische Integration

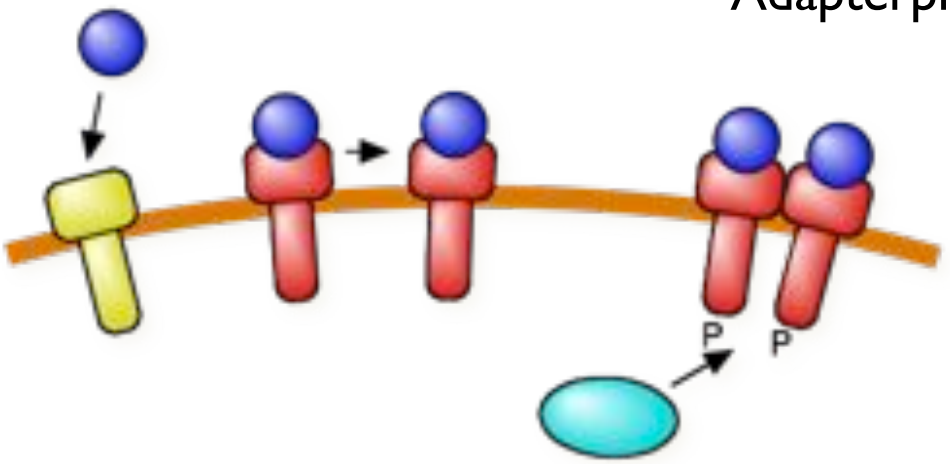
Kombinatorische Komplexität

Einfaches Modellsystem:

- externer monovalenter Ligand
- monovalente Rezeptor-Kinase
- Adapterprotein im Zytosol



Reaktionen:

- Rezeptor + Ligand
- Rezeptor-Dimere
- Phosphorylierung des Rezeptors
- Bindung des Adapterproteins

3 Spezies + 5 Regeln => 14 Kombinationen im Modell

BioNetGen: Regelbasierter "Biological Network Generator"

begin species
  1  L(r)       L0  # Ligand has one site for binding to receptor.
                    # L0 is initial concentration
  2  R(l,d,Y~U) R0  # Dimer has three sites: l for binding to a ligand,
                    # d for binding to another receptor, and
                    # Y - tyrosine. Initially Y is unphosphorylated, Y~U.
  3  A(SH2)     A0  # A has a single SH2 domain that binds phosphotyrosine
end species

begin reaction rules

# Ligand binding (L+R)
# Note: specifying r in R here means that the r component must not
#       be bound.  This prevents dissociation of ligand from R
#       when R is in a dimer.
  1  L(r) + R(l,d) <-> L(r!1).R(l!1,d) kp1, km1

# Aggregation (R-L + R-L)
# Note:  R must be bound to ligand to dimerize.
  2  R(l!+,d) + R(l!+,d) <-> R(l!+,d!2).R(l!+,d!2) kp2, km2

# Transphosphorylation
# Note:  R must be bound to another R to be transphosphorylated.
  3  R(d!+,Y~U) -> R(d!+,Y~P) p1

# Dephosphorylation
# Note:  R can be in any complex, but tyrosine is not protected by bound A.
  4  R(Y~P) -> R(Y~U) d1

# Adaptor binding phosphotyrosine (reversible).
# Note: Doesn't depend on whether R is bound to
#       receptor, i.e. binding rate is same whether R is a monomer, is
#       in association with a ligand, in a dimer, or in a complex.

  5  R(Y~P) + A(SH2) <-> R(Y~P!1).A(SH2!1) kpA, kmA
end reaction rules

begin observables
  Molecules R_dim  R(d!+)      # All receptors in dimer
  Molecules R_phos R(Y~P!?)    # Total of all phosphotyrosines
  Molecules A_R    A(SH2!1).R(Y~P!1) # Total of all A's associated with phosphotyrosines
  Molecules A_tot  A()     # Total of A. Should be a constant during simulation.
  Molecules R_tot  R()     # Total of R. Should be a constant during simulation.
  Molecules L_tot  L()     # Total of L. Should be a constant during simulation.
end observables

BioNetGen-Input für das Rezeptor-System von S 35

Zusammenfassung

SBML:

- hierarchisches XML-Schema
- es gibt viel Software, die SBML lesen und schreiben kann

Diffusion:

- Diffusionsgleichung
- Simulation mit "The Virtual Cell" im Tutorial nächste Woche

Kombinatorische Komplexität

- BioNetGen
